

# **PROVISIONAL FORECAST OF THE STATE POPULATION BY AGE AND SEX: 1990 TO 2020**

**NOVEMBER 2000 FORECAST**

## **Technical Notes**

---

The 1990 census population by age and sex, actual vital events through December 31, 1999, and the April 1, 2000 estimate of the state's population are utilized as the starting point for the forecast of Washington State population through 2020. A 1990 decennial Washington State life table was used to survive the population. Projections of life expectancy are based on Table B-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census. Age-specific fertility projections are based on Table-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census. The distribution of net migrants by age and sex was primarily derived from intercensal (1980-1990) estimates of the age-sex structure of migration for Washington State. Economic data used for developing the forecast of net migration provided by the Economic and Revenue Forecast Council, State of Washington (September, 2000) and Data Resources Inc (DRI).

### ***IMPORTANT NOTE:***

*Washington's census 2000 population count will be released by the Bureau of the Census on December 31, 2000. The state population forecast, as presented in this publication will be revised on the basis of the actual 2000 census figure. As population age data and other information required by demographic estimation and forecasting models become available over the next year, additional forecast revisions will be made.*

*Since this forecast is provisional, the accompanying support materials are abbreviated.*

## General Discussion of State Growth and Assumptions

The 2000 state population forecast is based on actual births and deaths through December 1999, the official 2000 estimate of the state's population, and a provisional estimate of the year 2001 population.

The 2000 state forecast shows a lower level of population growth than the forecast prepared in fall 1999. The primary reason for the adjustment is the lower than expected migration gains through spring 2000. Movement to Washington has been moderated by the continued strength of the national and California economies. Washington's employment opportunities have met with strong competition from other states. Aerospace employment reductions were another contributing factor. The state's migration gains, which remained between 50,000 and 60,000 for several years—dropped to 41,200 in 1998, 35,500 in 1999, and 10,500 in 2000. The migration forecast model and supplemental drivers and enrollment data indicate a turnaround for 2001. The provisional migration estimate for 2001 is 23,700.

### Comparison of Net Drivers Movement And School Migrants (Grades 2-8) 12-Month Moving Sum

Washington's population has increased by about 20 percent per decade since the 1960s and is still expected to grow by nearly 20 percent (19.2 percent) over the 1990s. The 2000 population estimate of 5,803,400 represents an increase of 936,700 over the last ten ears. The state population is expected to reach 6 million mid-decade, and nearly 7.5 million by 2020.

**Washington State shows strong historical population growth.  
Forecast growth is in line with historical experience.**

NOVEMBER 2000

## **Population and Components of Change**

The components of population change are births, deaths, and migration. The excess of births over deaths is called natural increase. Persons moving to Washington (immigration) minus persons leaving the state (outmigration) is net migration. Table 1 shows the components of population change for 1991 through 2020. Births from 1990 through 1999 are actual vital events.

### **Fertility**

Historic fertility levels in Washington, as in the nation, have followed a roller coaster pattern. However, since the mid-1980s the state's total fertility rate (TFR)—the average number of births per woman—has remained relatively constant. The average number of births per woman is actually a hypothetical value. It is the average lifetime births expected by a group of women if they followed the age-specific birth rates for a given year.

Actual birth levels in Washington increased and then stabilized as the Baby Boom generation aged to have children. Births are expected to rise again as this new bulge of youngsters reach adulthood and begin their families. Thus, even though total fertility is expected to remain relatively constant, changes in the number of women of child bearing age will continue to cause some fluctuation in fertility levels. The following outline shows some of the historic fertility peaks and valleys.

**Table 1. Population and Components of Change: 1990 to 2020**

-----Components of Change From Previous Period-----											
	Population at End of Period	Population Change		Births		Deaths		Natural Increase	Net Migration		
		Number	Percent	Number	Rate	Number	Rate		Number	Rate	
1990-1991	5,000,371	133,679	2.75	79,076	16.03	36,575	7.41	42,501	91,178	18.48

<b>1990-2020</b>		2,588,858		2,583,594		1437642		1,145,952	1442906		

Year	Social and Economic Climate	Number of Annual Births	Average Number of Births Per Woman
1933	Bottom of the Depression	20,800	1.6
1957	Peak of Baby Boom, economic prosperity	65,900	3.7
1975	Increases in working women, increased age at first marriage, and delayed childbearing.	49,500	1.7
1980s	Children of the Baby Boomers reach adulthood.	68,000 to 71,000	1.8 to 2.0
Early 1990s	Slight rise in fertility rates, delayed first/or second births recognized.	79,000 to 80,000	2.0 to 2.02
Late 1990s	Modest fluctuations in fertility levels, down and then up. Fewer women in peak childbearing age.	78,700	2.04
<hr/> -----Forecast-----			
2000-2020	Forecast follows U.S. Census Bureau national forecast assumptions. No major changes in average births per woman.	Births gradually increase from 79,500 to 101,000 by 2020	2.09

**Number of births per woman is expected to be low but a large number of women will have children between 1990 and 2020.**

OFM FORECASTING DIVISION

NOVEMBER 2000

If women were currently having children at birth rates comparable to the Baby Boom years—births would total 140,000 births per year. By the year 2020 there would be nearly 200,000 births per year. There is no indication that high fertility rates will return—not given the high level of women's participation in the labor force, delayed marriage, and delayed childbearing after marriage.

## Mortality

The first half of the 1900s saw dramatic improvements in nutrition and health care that reduced infant deaths and markedly increased life expectancy. After that time, gains in infant health and life expectancy continued, but at a slower pace. Infant death rates are now quite low. Bureau of the Census research indicates that from the late 1990s forward no medical breakthroughs are anticipated that will greatly increase life expectancy. Gains in life expectancy are expected to come from improved maternal health care, lifestyle changes, and treatment of hypertension.

The following outline shows improvements in life expectancy over time and future expectations.

Year	Infant Mortality/Comments	Number of Annual Deaths	Life Expectancy in Years	
			Male	Female
1920s	Large proportion of deaths to infants in first year of life—approximately 56 per 1,000.	15,000	58	60
1960	Major advances in nutrition and medicine occurred between 1920 and 1960. Infant mortality reduced to 23 per 1,000.	26,500	68	75
1980	Infant mortality reduced to 12 per 1,000.	32,000	72	79
Late 1990s	Large improvements in life expectancy unlikely. Infant mortality 8 per 1,000.	43,000-44,000	74	80
-----Forecast-----				
2020	Forecast follows U.S. Census Bureau recent national forecast assumptions. Slow but continued improvements in life expectancy.	60,500	77	83

## Migration

Migration, the most variable component of population change, is largely an economic phenomenon relating push and pull factors. Migration usually varies as the result of changing economic conditions in Washington relative to other states. Some migration, such as military movements or the migration of retired persons, is not economic.

**Net migration is a major contributor to population change in Washington State.**

OFM FORECASTING DIVISION

NOVEMBER 2000

Annual migration is developed separately for three time periods: (1) historical and current estimates, (2) near term projections, and (3) long term projections.

Year (s)	Method	Distinguishing Characteristics Of Method	Data and Assumptions (if applicable)
1990-2000	Estimates	Developed from estimates of annual population change based on <b>actual change</b> in several sets of symptomatic data	School enrollment, voters and automobile registrations, driver licenses, births, deaths and medicare enrollment.
2001	Provisional Estimate	Early actual data	School enrollment
2002, 2003	Near Term Projection	Regression model relating net migration to the state's near term relative economic performance.	Employment forecasts from the Economic and Revenue Forecast Council (Sept. 2000d data from Data Resources Inc. (DRI)) Washington's traded sector job growth becomes weaker than the US and California due to a slowdown in high tech manufacturing and a continued decline in aerospace employment.
2004, 2005, 2006	Transition Period		Three-year transition period blending the near term and long term projection
2007-2020	Long Term Projection	Regression model relating net migration to the state's long term relative economic performance. <i>Results expressed as average annual migration.</i>	Long-term employment forecasts from Bureau of Economic Analysis and DRI. Long term, Washington's traded sector and producer services employment is expected to outperform the US and California.

**Comparison of actual and predicted net migration using OFM's model, 1970-2000.**

OFM FORECASTING DIVISION

NOVEMBER 2000

*Projected migration is modeled with econometric techniques that integrate economic performance expectations with population outcomes by quantitatively relating changes in traded sector employment to net migration. The econometric model developed to project net migration for Washington State includes four major components:*

- ?? The percent change in Washington's traded sector employment relative to the percent change in traded sector employment in the U.S.
- ?? The percentage change in Washington's traded sector employment relative to the percentage change in traded sector employment in California, lagged one year.
- ?? The U.S. unemployment rate.
- ?? Net migration in the previous year.

"Traded" industries include manufacturing, federal civilian government, and producer services (services purchased by businesses). Changes in state traded sector employment are closely associated with varying levels of net migration over time.
